» packet_precreated_ip_block

Use this data source to get CIDR expression for precreated IPv6 and IPv4 blocks in Packet. You can then use the cidrsubnet TF builtin function to derive subnets.

» Example Usage

```
# Create project, device in it, and then assign /64 subnet from precreated block
# to the new device
resource "packet_project" "test" {
    name = "testpro"
}
resource "packet_device" "web1" {
 hostname = "tftest"
                  = "baremetal_0"
 plan
                 = "ewr1"
 facility
  operating_system = "ubuntu_16_04"
 billing_cycle = "hourly"
                  = "${packet_project.test.id}"
 project_id
}
# we have to make the datasource depend on the device. Here I do it implicitly
# with the project_id param, because an explicity "depends_on" attribute in
# a datasource taints the state:
# https://github.com/hashicorp/terraform/issues/11806
data "packet_precreated_ip_block" "test" {
    facility
                    = "ewr1"
    project_id
                    = "${packet_device.test.project_id}"
    address_family = 6
    public
                    = true
}
# The precreated IPv6 blocks are /56, so to get /64, we specify 8 more bits for network.
# The cirdsubnet interpolation will pick second /64 subnet from the precreated block.
resource "packet_ip_attachment" "from_ipv6_block" {
    device_id = "${packet_device.web1.id}"
    cidr_notation = "${cidrsubnet(data.packet_precreated_ip_block.test.cidr_notation,8,2)}"
}
```

» Argument Reference

- project_id (Required) ID of the project where the searched block should be.
- address_family (Required) 4 or 6, depending on which block you are looking for.
- public (Required) Whether to look for public or private block.
- facility (Required) Facility of the searched block.

» Attributes Reference

• cidr_notation - CIDR notation of the looked up block.

» packet_device

Provides a Packet device resource. This can be used to create, modify, and delete devices.

Note: All arguments including the root_password and user_data will be stored in the raw state as plain-text. Read more about sensitive data in state.

» Example Usage

```
# Create a device and add it to cool_project
resource "packet_device" "web1" {
 hostname
                 = "tf.coreos2"
                  = "baremetal_1"
 plan
                 = "ewr1"
 facility
  operating_system = "coreos_stable"
                = "hourly"
 billing_cycle
 project_id
                  = "${packet_project.cool_project.id}"
}
# Same as above, but boot via iPXE initially, using the Ignition Provider for provisioning
resource "packet_device" "pxe1" {
                 = "tf.coreos2-pxe"
 hostname
                  = "baremetal_1"
 plan
                  = "ewr1"
  facility
  operating_system = "custom_ipxe"
 billing_cycle
                = "hourly"
                  = "${packet_project.cool_project.id}"
 project_id
 ipxe_script_url = "https://rawgit.com/cloudnativelabs/pxe/master/packet/coreos-stable-packet/
                  = "false"
  always pxe
```

```
= "${data.ignition_config.example.rendered}"
  user_data
# Deploy device on next-available reserved hardware and do custom partitioning.
resource "packet_device" "web1" {
                  = "tftest"
 hostname
                   = "baremetal_0"
 plan
                   = "sjc1"
 facility
  operating_system = "ubuntu_16_04"
                = "hourly"
 billing_cycle
                  = "${packet_project.cool_project.id}"
 project_id
 hardware_reservation_id = "next-available"
  storage = <<EOS

             "-L",
             "SWAP"
           1
      }
    }
  ]
  EOS
}
```

» Argument Reference

The following arguments are supported:

- hostname (Required) The device name
- project_id (Required) The id of the project in which to create the device
- operating_system (Required) The operating system slug
- facility (Required) The facility in which to create the device
- plan (Required) The hardware config slug
- billing_cycle (Required) monthly or hourly
- user_data (Optional) A string of the desired User Data for the device.
- public_ipv4_subnet_size (Optional) Size of allocated subnet, more information is in the Custom Subnet Size doc.
- ipxe_script_url (Optional) URL pointing to a hosted iPXE script. More information is in the Custom iPXE doc.
- always_pxe (Optional) If true, a device with OS custom_ipxe will continue to boot via iPXE on reboots.
- hardware_reservation_id (Optional) The id of hardware reservation where you want this device deployed, or next-available if you want to pick your next available reservation automatically.
- storage (Optional) JSON for custom partitioning. Only usable on re-

served hardware. More information in in the Custom Partitioning and RAID doc.

» Attributes Reference

The following attributes are exported:

- id The ID of the device
- hostname- The hostname of the device
- project id- The ID of the project the device belongs to
- facility The facility the device is in
- plan The hardware config of the device
- network The device's private and public IP (v4 and v6) network details
- ${\tt access_public_ipv6}$ The ipv6 maintenance IP assigned to the device
- $access_public_ipv4$ The ipv4 maintenance IP assigned to the device
- access_private_ipv4 The ipv4 private IP assigned to the device
- locked Whether the device is locked
- billing_cycle The billing cycle of the device (monthly or hourly)
- operating_system The operating system running on the device
- state The status of the device
- created The timestamp for when the device was created
- updated The timestamp for the last time the device was updated
- tags Tags attached to the device
- hardware_reservation_id The id of hardware reservation which this device occupies
- root_password Root password to the server (disabled after 24 hours)

» packet_project

Provides a Packet Project resource to allow you manage devices in your projects.

» Example Usage

» Argument Reference

The following arguments are supported:

- name (Required) The name of the Project on Packet.net
- payment_method (Optional) The unique ID of the payment method on file to use for services created in this project. If not given, the project will use the default payment method for your user.

» Attributes Reference

The following attributes are exported:

- id The unique ID of the project
- payment_method The unique ID of the payment method on file to use for services created in this project.
- created The timestamp for when the Project was created
- updated The timestamp for the last time the Project was updated

» packet_ssh_key

Provides a Packet SSH key resource to allow you manage SSH keys on your account. All SSH keys on your account are loaded on all new devices, they do not have to be explicitly declared on device creation.

» Example Usage

» Argument Reference

The following arguments are supported:

- name (Required) The name of the SSH key for identification
- public_key (Required) The public key. If this is a file, it can be read using the file interpolation function

» Attributes Reference

The following attributes are exported:

• id - The unique ID of the key

- name The name of the SSH key
- public_key The text of the public key
- fingerprint The fingerprint of the SSH key
- created The timestamp for when the SSH key was created
- updated The timestamp for the last time the SSH key was updated

» packet_volume

Provides a Packet Block Storage Volume resource to allow you to manage block volumes on your account. Once created by Terraform, they must then be attached and mounted using the api and packet_block_attach and packet_block_detach scripts.

» Example Usage

```
# Create a new block volume
resource "packet_volume" "volume1" {
 description = "terraform-volume-1"
               = "ewr1"
 facility
 project_id
               = "${packet_project.cool_project.id}"
               = "storage_1"
 plan
  size
                = 100
 billing_cycle = "hourly"
  snapshot_policies = {
    snapshot_frequency = "1day"
    snapshot_count = 7
 }
  snapshot_policies = {
    snapshot_frequency = "1month"
    snapshot_count = 6
}
```

» Argument Reference

The following arguments are supported:

- plan (Required) The service plan slug of the volume
- facility (Required) The facility to create the volume in

- project_id (Required) The packet project ID to deploy the volume in
- size (Required) The size in GB to make the volume
- billing_cycle The billing cycle, defaults to "hourly"
- description Optional description for the volume
- snapshot_policies Optional list of snapshot policies

» Attributes Reference

The following attributes are exported:

- id The unique ID of the volume
- name The name of the volume
- description The description of the volume
- size The size in GB of the volume
- plan Performance plan the volume is on
- billing_cycle The billing cycle, defaults to hourly
- facility The facility slug the volume resides in
- state The state of the volume
- locked Whether the volume is locked or not
- project_id The project id the volume is in
- attachments A list of attachments, each with it's own href attribute
- created The timestamp for when the volume was created
- updated The timestamp for the last time the volume was updated

» packet volume attachment

Provides attachment of Packet Block Storage Volume to Devices.

Device and volume must be in the same location (facility).

Once attached by Terraform, they must then be mounted using the packet_block_attach and packet_block_detach scripts.

» Example Usage

```
resource "packet_project" "test_project" {
    name = "test-project"
}

resource "packet_device" "test_device_va" {
    hostname = "terraform-test-device-va"
    plan = "baremetal_0"
    facility = "ewr1"
    operating_system = "ubuntu_16_04"
```

```
= "hourly"
    billing_cycle
    project_id
                    = "${packet_project.test_project.id}"
}
resource "packet_volume" "test_volume_va" {
    plan = "storage_1"
    billing_cycle = "hourly"
    size = 100
    project_id = "${packet_project.test_project.id}"
    facility = "ewr1"
    snapshot_policies = { snapshot_frequency = "1day", snapshot_count = 7 }
}
resource "packet_volume_attachment" "test_volume_attachment" {
    device_id = "${packet_device.test_device_va.id}"
    volume_id = "${packet_volume.test_volume_va.id}"
```

» Argument Reference

The following arguments are supported:

- volume_id (Required) The ID of the volume to attach
- device_id (Required) The ID of the device to which the volume should be attached

» Attributes Reference

The following attributes are exported:

• id - The unique ID of the volume attachment
