# » mailgun_domain

Provides a Mailgun App resource. This can be used to create and manage applications on Mailgun.

## » Example Usage

```
# Create a new Mailgun domain
resource "mailgun_domain" "default" {
  name          = "test.example.com"
  spam_action   = "disabled"
  smtp_password = "foobar"
}
```

## » Argument Reference

The following arguments are supported:

- `name` - (Required) The domain to add to Mailgun
- `smtp_password` - (Required) Password for SMTP authentication
- `spam_action` - (Optional) `disabled` or `tag` Disable, no spam filtering will occur for inbound messages. Tag, messages will be tagged with a spam header.
- `wildcard` - (Optional) Boolean that determines whether the domain will accept email for sub-domains.
